

# Warning surface (platform edge)

## Tactile flooring

This stud pattern signage surface, placed in parallel a few centimetres before the danger area, warns of the danger.

It is of common use in railway infrastructures as platform edge warning signage but it is also useful to warn on the presence of pronounced difference in elevations or other hazardous areas.

Accessibility standards recommend that said surface has a well contrasted colour different than the surrounding paving, preferably, bright and eye-catching yellow, associated to a warning signal.

Warning surface design is defined by the standards and recommendations of each country.

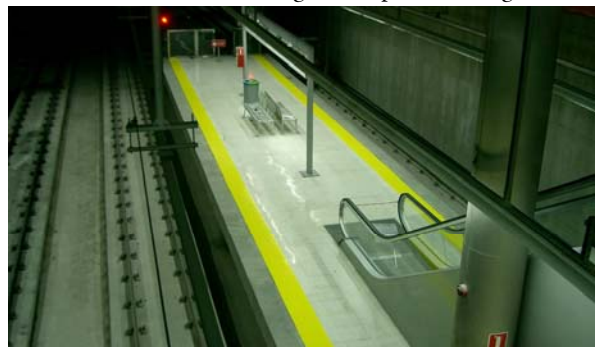

This applies to:

- ◆ surface dimensions;
- ◆ base plate and embossing height;
- ◆ pattern and design;
- ◆ colour
