

# Directional guiding system

## Tactile flooring

Directional guiding systems are used to offer the visually impaired the possibility of being self-sufficient in the surrounding environment.

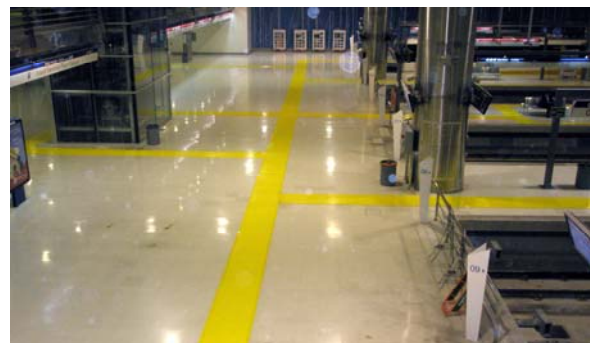

The function of this system is to create pathways along which persons can move and reach areas of interest. It must be arranged parallel to the walking line and the standard colours are yellow, blue, light grey and dark grey.

We offer wayfinding systems consisting of guidance paths, single junction tiles and multidirectional junction tiles made to measure as per standards and recommendations of each country.

This applies to:

- ◆ guidance paths and junction tiles dimensions, combination of different designs and custom solutions being possible;
- ◆ base plate and embossing height;
- ◆ pattern and design (studs, flat strips, waves...);
- ◆ colour (to contrast the surrounding floor, or blend with other elements of the environment, or to adapt to corporate colours).
