

Warning surface (information)

Tactile flooring

Information surfaces are essential to complete the tactile signage map that the visually impaired need to be self-sufficient in public places, and are also used for way-finding assistance to all types of public.

As a general rule, they are surfaces wider than one metre, featuring grooved, corrugated or studs in bright colours that contrast the surrounding paving, placed in strategic points. Standard colours used are yellow, blue, light grey and dark grey.

These surfaces mark the platform head or end (safety area), a lift or stairs access area, warn of the location of ticket windows, ticket machines or any other point of interest.

Regulations, uses and customs of each country define signage dimensions, designs and colours. This applies to:

- ◆ surface dimensions;
- ◆ base plate and embossing height;
- ◆ pattern and design (studs, flat strips, waves ...);
- ◆ colour (to contrast the surrounding floor, or blend with other elements of the environment, or to adapt to corporate colours).
