

Adhesive

Tactile flooring

Tactile flooring surfaces are fixed to the floor using a two component adhesive that experience has shown to be highly effective in all types of installations, whether indoor or outdoor.

Its short setting time allows for the installation work to be carried out during the night closing period, opening to the public as usual. Only, as a precautionary measure, an adhesive tape protection is placed around the surface periphery during 24 more hours.

The adhesive fulfils a two-fold function, the already cited of fixing the tactile surfaces to the floor and also the joint sealing function. That is why this product is supplied with the colour corresponding to the items to be installed, for an elegant and uniform finish.

It being a two component adhesive, material handling is made without risk as the mixture is prepared at the installation place.

For more details, see manufacturer's material safety data sheets.
